

FASTORQ® A/G

Application Instructions

1. Open container. If small amounts of oil are standing on the surface mix thoroughly before using.
2. Do not use with Teflon tape and avoid contamination with other lubricants, which will detract from the compound's effectiveness.
3. Clean and dry all surfaces to be lubricated.
4. Apply with brush from brush top can, toothbrush or other convenient implement.
5. Normally, all threaded surfaces should be covered. The face of the nut next to the flange should also be coated in the case of bolted connections. Where it is desirable that thread compounds not be allowed to enter the stream flowing through pipe or fittings, carefully lubricate all threads except those closest to the flow.
6. Only a thin coat of FASTORQ A/G is needed. Avoid using excessive amounts.
7. Do not use this product in applications where temperature exceeds 550 degrees Fahrenheit.
8. Replace lid after use and store at room temperature.
